PROFILE

Python developer with commercial experience since 2022 in PostgreSQL/PostGIS data processing, automation and external API integrations. I build FastAPI and SQLAlchemy applications in personal and client projects, focusing on explicit business rules, typed contracts and reliable data workflows.

CORE SKILLS

Backend	Python · FastAPI · asyncio · aiohttp · Pydantic
SQL / Data	PostgreSQL · PostGIS · SQLAlchemy · psycopg · Alembic
Quality	pytest · Integration tests · Ruff · mypy · GitHub Actions
Delivery	Docker · Compose · Linux · Git · External APIs

PROFESSIONAL EXPERIENCE

Software Engineer · Maxim Technology

February 2022 – Present · Remote

- Built the complete Python tool for selecting and processing records, exporting SQL files and loading SQL data into a database. One run handled up to 46 million address records in approximately 6–8 hours.
- Develop and maintain Python/SQL workflows for address and geospatial data normalization, enrichment, bulk imports and exports in PostgreSQL/PostGIS.
- Refactored geocoding integrations with concurrent requests, retries, API-quota handling and explicit error processing.
- Investigate data-quality and SQL performance issues using database queries, execution plans and application logs; document technical findings.

CLIENT WORK

Freelance Python Developer

Project-based engagements · Since approximately 2020

- Delivered supplier-to-Ozon stock synchronization: transformed inventory data and integrated the marketplace workflow with Python.
- Built CSV/Excel/JSON processing utilities and browser/API automation; packaged selected solutions for Docker/Linux.
- Developed Telegram interfaces for controlling server utilities, changing settings and inspecting logs.

SELECTED ENGINEERING PROJECTS

Portfolio work includes AI-assisted implementation. My work spans requirements, integration, validation and delivery; the projects below are personal engineering applications.

Moon Courier Crisis · Source

FastAPI · SQLAlchemy · Unit of Work · Vue 3 · Docker

A logistics simulation with backend-owned delivery rules. The API checks routes, cargo and battery constraints; the interface renders server results. Separated domain services and persistence, with automated tests and reproducible Docker Compose startup.

Geospatial ETL Pipeline · Source

Python · Apache Airflow · PostgreSQL · MinIO/S3 · Shapely

Four connected DAGs read locality polygons, generate coordinate grids, call Yandex Geocoder under API quotas and export deduplicated district data. Intermediate results are stored outside task memory. A personal orchestration project, separate from commercial PostgreSQL work.

Support Assistant · Source

FastAPI · OpenRouter · JSON Schema · Pydantic · Redis · Vue 3

An IT-ticket demonstration under development. An LLM proposes a department; the user confirms or changes it before description generation. Schema validation, retries, timeouts and shared quotas control the external integration. Ports isolate the model provider from application logic.

EDUCATION

Kazan Federal University · Applied Mathematics and Computer Science · 2021–2026 · Completed
